

Coupling system for non-abrasive and non-corrosive applications

Built-in (full-bore) coupling system

Built-in (full-bore) coupling system

Steel fittings are built-in and vulcanised into the hose body during manufacture; forming a permanent part of the hose assembly. The fitting is chemically-bonded and mechanically-locked into position with fully embedded retaining wire between single or twin bands. Built-in fittings are designed for heavy-duty use and medium to high-pressure applications.
